

Your Audi/VW hiring dashboard in Power BI

A four-page report built from **AUDI_VW_Final_Funnel_V2_Clean.xlsx**. It shows where candidates drop out of the funnel, how each recruiter converts, and whether accepted offers will cover each joining wave. Every number in the preview below was calculated from your file.

131 unique candidates (134 interview records) **10 Aug – 15 Sep 2026** interview dates

20 offers, **12** accepted **80** analysts needed by 1 Nov

Overview: the one-screen status. The funnel shows the biggest drop is between passing interviews and receiving an offer; the wave chart shows accepted offers falling behind demand from wave 2 onwards.

What your file tells us

The workbook has four sheets. Two of them hold real, row-level data and should drive the whole dashboard. The other two are typed-in summaries that no longer match the raw data, so we'll only borrow the wave schedule from one of them.

Sheet	What it contains	How we use it
Candidate Tracker	134 interview records(Excel table Table4) with recruiter, technical, ops and final decision, plus written feedback.	Main table: Candidates
Offering Sheet	20 offers with joining date and offer status.	Second table: Offers
SD Analyst Overview	Five joining waves (1 Sep to 1 Nov) with demand, plus hand-typed wave 1 totals.	Only Wave, Join Date and Demand: Waves
Roles Overview	One hand-typed summary row.	Not loaded

Calculated straight from the rows the funnel looks like this:

Calculated straight from the rows, the funnel looks like this:

The headline story for the dashboard: interviewing is not the bottleneck. Recruiters have 35 approved candidates waiting, and converting them to offers is the fastest way to close the gap to demand.

Data issues the build handles for you

Issue	Why it matters	What the guide does
The summary sheets disagree with the raw data. SD Analyst Overview shows 51 offers, 47 accepted and 9 joined; the Offering Sheet has 20, 12 and 1. Roles Overview says demand is 40, while the wave plan reaches 80.	A dashboard built on those cells would report the wrong numbers.	Every figure is calculated from the Candidate Tracker and Offering Sheet. Please confirm whether total demand is 40 or 80.
Five names are spelled differently between the two sheets (for example <i>Marawan Ali Sadek</i> vs <i>Marwan Ali Sadek</i> , <i>Berta Email</i> vs <i>Berta Emil</i>).	Offers can't be linked to their recruiter or interview.	The Candidates query renames them to the Offering Sheet spelling. Please confirm Saleh Saleh = Saleh Essam.
Mennatullah Sherif, Nouran Ashraf and Sara Ali each appear twice (re-interviews).	Candidates would be counted twice.	Keeps one row per person: the best outcome they reached.
Source, Joined, Join Date and Current Stage are empty; Joining Date mixes dates with text such as "October 2026".	Nothing to analyse, and mixed types cause load errors.	Those columns are dropped. Joining dates come from the Offering Sheet.
Abdelrahman Elbarbary has an offer but no tracker row; Shrouk Elsbaikh	Small gaps in recruiter totals	Elbarbary still counts in offer totals; Shrouk shows as

but no recruiter row, on our list. This
has no recruiter.

recruiter totals.

totals, on our shows as
"Unassigned".

What each page shows

Use the tabs under the preview to see each page. Here is what goes on them and the question each visual answers.

Page 1: Overview

The one-screen status for a manager: how many candidates are in the pipeline, how they convert, and whether accepted offers cover each wave.

Visual	Answers
Six KPI cards	Candidates, attended, pass rate, offers made, offers accepted, gap to demand.
Funnel	Where do we lose the most people? (Biggest drop: passed to offer, 54 to 20.)
Line and stacked column chart by wave	Are we on track for each joining wave? Columns are offers per wave; lines are cumulative demand vs cumulative accepted.
Offer status donut	How healthy is the offer stage?
"Passed, but no offer yet" card	What is the quickest action to close the gap?

Page 2: Interview pipeline

For the recruitment team's weekly review: volume, outcomes, no-shows and recruiter conversion.

Visual	Answers
Stacked columns by interview week	Is interview volume growing, and what share passes each week?
Bar chart of non-passing outcomes	Are we losing people to rejections, no-shows or scheduling?
Recruiter table with traffic-light icons	Which recruiter's candidates show up and pass?

Technical vs ops matrix

Do the two interview panels agree?

Page 3: Offers and joining

For onboarding planning: who is joining when, which offers still need chasing.

Visual	Answers
Five KPI cards	Accepted, in progress, lost, acceptance rate, passed without offer.
Stacked columns by joining week	How many people start each week?
Stacked bars by recruiter	Whose offers are accepted, pending or lost?
Offer list table	Which named candidates still need follow-up?

Page 4: Candidate profile

A drill-through page. Right-click any candidate name elsewhere in the report and jump to their interview results, offer and the interviewer's full written feedback.

Build it step by step

You need Power BI Desktop (free from the Microsoft Store) and about two hours. You import the workbook with **Get data › Excel workbook**, then paste a short cleaning script into each query, so you don't have to click through dozens of transformations. Visual steps are described click by click.

1 Prepare the file

1. Save **AUDI_VW_Final_Funnel_V2_Clean.xlsx** in a folder it will stay in, for example `C:\Users\YourName\Documents\Hiring\`. Power BI remembers where the file is, so moving it later breaks refresh (step 15 explains how to repoint it).
2. Close the file in Excel while you build. Power BI can fail to read a workbook that is open with unsaved changes.

Keep the sheet names, the table name **Table4** and the column headers exactly as they are. The cleaning scripts look them up by name.

2 Import the workbook with Get data

1. Open Power BI Desktop and start a blank report.
2. Click **Home** › **Get data** › **Excel workbook**. Browse to your file and click **Open**.
3. The **Navigator** window lists everything in the workbook. Items with a table icon are Excel tables; items with a grid icon are sheets. Tick these three:

Tick	Type	Why
Table4	Table	The candidate tracker. Use the table rather than the <i>Candidate Tracker</i> sheet: it has clean headers and grows automatically when you add rows in Excel.
Offering Sheet	Sheet	The 20 offers.
SD Analyst Overview	Sheet	The wave schedule and demand.

Leave *Candidate Tracker* and *Roles Overview* unticked.

4. Click **Transform Data**, not Load. The Power Query Editor opens with three queries in the **Queries** pane on the left.
5. Rename them so the rest of the guide matches: right-click each query › **Rename**.

Current name	New name
Table4	Candidates
Offering Sheet	Offers
SD Analyst Overview	Waves

Power BI has already added a few steps to each query (you can see them under **Applied Steps** on the right), such as *Navigation*, *Promoted Headers* and *Changed Type*. The first step, **Source**, is the connection to your Excel file. In steps 3 to 5 you keep that Source step and replace everything after it with a cleaning script.

How to paste a script under the Source step

You'll do this three times, once per query.

1. Click the query in the **Queries** pane.
2. Click **Home** › **Advanced Editor**. The code will look similar to this (your path and step names may differ):

What Power BI generated

```
let
    Source = Excel.Workbook(File.Contents("C:\Users\YourName\Documents\Hiring
    Table4_Table = Source{[Item="Table4",Kind="Table"]}[Data],
    #"Changed Type" = Table.TransformColumnTypes(Table4_Table, { ... })
in
    #"Changed Type"
```

3. Keep the first two lines: `let` and the whole `Source = Excel.Workbook(...)` line, including its comma at the end.
4. Select everything below the `Source` line, all the way to the last line, and delete it.
5. Click at the end of the `Source` line, press `Enter`, and paste the script for that query.
6. Click **Done**.

After pasting, the top of the query should read:

Correct start of every query

```
let
    Source = Excel.Workbook(File.Contents("C:\... \AUDI_VW_Final_Funnel_V2_Clean.
    ...the pasted script continues here...
```

If you see an error after clicking Done:

Token Comma expected or Token Eof expected: a line from Power BI's old code is still there, or the comma at the end of the `Source` line was deleted.

The name 'Source' wasn't recognized: your Power BI may use a translated step name (for example in another display language). Change the start of that line to `Source = .`

3 Clean the Candidates query

This script keeps the useful columns, fixes name spellings, labels each candidate's

outcome and removes the three duplicates.

1. Select **Candidates**, open the **Advanced Editor** and paste this script under the Source line, as described in step 2.
2. Click **Done**. You should see 131 rows (the row count shows at the bottom left of the editor).

Power Query (M): paste under Source in Candidates

Copy

```
Tracker = Source{[Item = "Table4", Kind = "Table"]}[Data],

// Only the columns that contain data
KeepColumns = Table.SelectColumns(Tracker,
    {"Name", "Date", "Recruiter", "HR Screening", "Technical", "Ops", "Accep
Typed = Table.TransformColumnTypes(KeepColumns, {
    {"Name", type text}, {"Date", type date}, {"Recruiter", type text},
    {"HR Screening", type text}, {"Technical", type text}, {"Ops", type text
    {"Accepted", type text}, {"Feedback", type text}}),

// Match the spelling used in the Offering Sheet
NameFixes = [
    #"Marawan Ali Sadek" = "Marwan Ali Sadek",
    #"Hossam Abdel Monem" = "Hossam Abdel-Moneim",
    #"Hager Talat Ibrahim" = "Hagar Talaat",
    #"Berta Email" = "Berta Emil",
    #"Saleh Saleh" = "Saleh Essam"
],
CleanNames = Table.TransformColumns(Typed,
    {"Name", each Record.FieldOrDefault(NameFixes, Text.Trim(_), Text.Trim(
FillRecruiter = Table.ReplaceValue(CleanNames, null, "Unassigned", Replacer.

// One readable outcome per candidate
AddOutcome = Table.AddColumn(FillRecruiter, "Outcome", each
    if [Accepted] = null then "Pending interview"
    else if [Accepted] = "NCNS" then "No show"
    else [Accepted], type text),

// Re-interviewed candidates: keep the best outcome they reached
AddRank = Table.AddColumn(AddOutcome, "Outcome Rank", each
    List.PositionOf({"Accepted", "Rejected", "Pending interview", "Reschedul
    Int64.Type),
Sorted = Table.Buffer(Table.Sort(AddRank, {"Name", Order.Ascending}, {"Outc
OnePerCandidate = Table.Distinct(Sorted, {"Name"}),

AddWeek = Table.AddColumn(OnePerCandidate, "Week Start", each Date.StartOfWeek
in
AddWeek
```

Check: the Outcome column should contain six values: Accepted, Rejected, No show, Rescheduled, Cancelled and Pending interview. Click the filter arrow on its header to see them. If a name spelling is corrected in Excel later, remove its line from `NameFixes` .

4 Clean the Waves query

This keeps the wave schedule and demand from SD Analyst Overview and ignores the hand-typed totals.

1. Select **Waves**, open the **Advanced Editor** and paste this under the Source line.
2. Click **Done**. You should see 5 rows.

Power Query (M): paste under Source in Waves

Copy

```
Sheet = Source{[Item = "SD Analyst Overview", Kind = "Sheet"]}[Data],
Promoted = Table.PromoteHeaders(Sheet, [PromoteAllScalars = true]),
KeepColumns = Table.SelectColumns(Promoted, {"Wave", "Join Date", "Demand"})
RemoveBlankRows = Table.SelectRows(KeepColumns, each [Wave] <> null),
Typed = Table.TransformColumnTypes(RemoveBlankRows,
    {"Wave", type text}, {"Join Date", type date}, {"Demand", Int64.Type})
Renamed = Table.RenameColumns(Typed, {"Demand", "Cumulative Demand"}),
AddWaveNo = Table.AddIndexColumn(Renamed, "Wave No", 1, 1, Int64.Type),

// Demand goes 16, 32, 48, 64, 80, so each wave adds 16 new hires
AddNewHires = Table.AddColumn(AddWaveNo, "New Hires Needed", each
    [Cumulative Demand] - (if [Wave No] = 1 then 0 else AddWaveNo{[Wave No]
    Int64.Type)

in
AddNewHires
```

Confirm the demand numbers. The guide reads 16, 32, 48, 64, 80 as a running total (80 analysts by 1 Nov). If each wave actually needs its own 16, 32, 48 and so on, the total would be 240. If the real target is the 40 on Roles Overview, update the Demand column in Excel and refresh.

5 Clean the Offers query

This turns "TBC" joining dates into blanks, groups the six offer statuses into Accepted, In progress and Lost, and assigns each offer to a wave.

1. Select **Offers**, open the **Advanced Editor** and paste this under the Source line.
2. Click **Done**. You should see 20 rows.

Power Query (M): paste under Source in Offers

Copy

```

Sheet = Source{[Item = "Offering Sheet", Kind = "Sheet"]}[Data],
Promoted = Table.PromoteHeaders(Sheet, [PromoteAllScalars = true]),
KeepColumns = Table.SelectColumns(Promoted, {"Candidate Full Name", "Joining Date", "Offer Status", "Offer Group", "Wave", "Join Date", "Week"},
Renamed = Table.RenameColumns(KeepColumns, {"Candidate Full Name", "Name"}),
RemoveBlankRows = Table.SelectRows(Renamed, each [Name] <> null),
Cleaned = Table.TransformColumns(RemoveBlankRows, {
    {"Name", each Text.Trim(Text.From(_)), type text},
    {"Joining Date", each try Date.From(_) otherwise null, type nullable date},
    {"Offer Status", each Text.Trim(Text.From(_)), type text}},

AddGroup = Table.AddColumn(Cleaned, "Offer Group", each
    if List.Contains({"Offer Released And Accepted", "Joined"}, [Offer Status]) then "Accepted"
    else if List.Contains({"Offer In Progress", "Offer Released"}, [Offer Status]) then "In Progress"
    else "Lost", type text),

// Wave = the latest wave that starts on or before the joining date
WaveSheet = Table.PromoteHeaders(Source{[Item = "SD Analyst Overview", Kind = "Sheet"]}[Data], [PromoteAllScalars = true]),
WaveStarts = Table.SelectRows(
    Table.TransformColumns(Table.SelectColumns(WaveSheet, {"Wave", "Join Date", "Week"},
        {"Join Date", each try Date.From(_) otherwise null, type nullable date},
        each [Wave] <> null and [Join Date] <> null),
AddWave = Table.AddColumn(AddGroup, "Wave", each
    let
        d = [Joining Date],
        started = if d = null then {} else Table.SelectRows(WaveStarts, (w)
            <= d),
    in
        if d = null then "TBC"
        else if List.IsEmpty(started) then "Before Wave 1"
        else List.Max(started), type text),

AddWeek = Table.AddColumn(AddWave, "Joining Week", each
    if [Joining Date] = null then null else Date.StartOfWeek([Joining Date],
in
    AddWeek

```

Check: Offer Group should show 12 Accepted, 6 In progress and 2 Lost. The wave schedule is read again inside this query, rather than taken from the Waves query, on purpose: it avoids Power BI's "Formula.Firewall" error.

When all three queries look right, click **Home > Close & Apply**.

6 Add two helper tables

The funnel visual needs a list of stage names, and a separate table keeps all measures in one tidy place.

1. Click **Home** › **Enter data**. Rename *Column1* to `Order` and add a second column `Stage` (click the **+**). Type these seven rows:

Order	Stage
1	Candidates
2	Attended interview
3	Passed technical
4	Passed technical and ops
5	Offer made
6	Offer accepted
7	Joined

Name the table `Funnel Stages` and click **Load**.

2. Click **Home** › **Enter data** again. Don't type anything; name the table `_Measures` and click **Load**.

7 Set relationships and sort orders

1. Click the **Model view** icon on the left bar (three connected boxes).
2. If Power BI created any relationships automatically, right-click each line and choose **Delete**, so you start clean.
3. Drag **Name** from **Offers** onto **Name** in **Candidates**. In the dialog set **Cardinality** to **Many to one (*:1)** and **Cross filter direction** to **Single**. Click **Save**.
4. Drag **Wave** from **Offers** onto **Wave** in **Waves**. Again choose **Many to one** and **Single**, then **Save**.
5. Leave **Funnel Stages** and **_Measures** unconnected.
6. Switch to **Table view** (grid icon). Select the **Funnel Stages** table, click the **Stage** column, then **Column tools** › **Sort by column** › **Order**

Column, then **Column tools** › **Sort by column** › **Order**.

7. Select the **Waves** table, click the **Wave** column, then **Sort by column** › **Wave No**.
8. Still in Table view, click **Candidates** › **Date** and set **Column tools** › **Format** to **dd/mm/yyyy**. Do the same for **Offers** › **Joining Date**.

Check: in Model view you should see two arrows pointing away from Candidates and Waves into Offers. That means filters flow from candidates and waves to offers, never the other way.

8 Create the measures

Measures are the calculations behind every card and chart.

1. Go back to **Report view**. In the **Data** pane on the right, click the **_Measures** table.
2. Click **Home** › **New measure**. A formula bar appears at the top.
3. Copy one measure from the block below (from its name to the end of its formula), paste it over the text in the formula bar and press **Enter**.
4. Repeat for every measure. Order matters: later measures use earlier ones.
5. Format the rates as percentages: click **Show-up Rate**, **Pass Rate** and **Offer Acceptance Rate** one at a time, then **Measure tools** › **Format** › **Percentage** with 0 decimal places.
6. Once there's at least one measure, right-click **Column1** in **_Measures** and choose **Hide in report view**. The table moves to the top of the Data pane with a calculator icon.

DAX: all measures (create one at a time)

Copy

```
Candidates = COUNTROWS ( Candidates )
```

```
Attended Interview =  
CALCULATE ( [Candidates], Candidates[Technical] IN { "Passed", "Failed" } )
```

```
Passed Technical =  
CALCULATE ( [Candidates], Candidates[Technical] = "Passed" )
```

```
Passed Both =  
CALCULATE ( [Candidates], Candidates[Outcome] = "Accepted" )
```

```
No Shows =  
CALCULATE ( [Candidates], Candidates[Outcome] = "No show" )
```

```
Show-up Rate =  
DIVIDE ( [Attended Interview] [Attended Interview] + [No Shows] )
```

DIVIDE ([Passed Interview], [Passed Interview] : [No Shows])

Pass Rate =

DIVIDE ([Passed Both], [Attended Interview])

Offers Made = COUNTROWS (Offers)

Offers Accepted =

CALCULATE ([Offers Made], Offers[Offer Group] = "Accepted")

Offers In Progress =

CALCULATE ([Offers Made], Offers[Offer Group] = "In progress")

Offers Lost =

CALCULATE ([Offers Made], Offers[Offer Group] = "Lost")

    FILTER (
        Candidates,
        Candidates[Outcome] = "Accepted"
        && ISEMPTY ( RELATEDTABLE ( Offers ) )
    )
)
```

Total Demand =

CALCULATE (MAX (Waves[Cumulative Demand]), REMOVEFILTERS (Waves))

Gap to Demand = [Total Demand] - [Offers Accepted]

Cumulative Demand = MAX (Waves[Cumulative Demand])

Cumulative Accepted =

VAR LastJoinDate = MAX (Waves[Join Date])

RETURN

```
CALCULATE (
    [Offers Accepted],
    REMOVEFILTERS ( Waves ),
    Waves[Join Date] ≤ LastJoinDate
)
```

Funnel Value =

```
SWITCH (
    SELECTEDVALUE ( 'Funnel Stages'[Order] ),
    1, [Candidates],
    2, [Attended Interview],
```

```
3, [Passed Technical],  
4, [Passed Both],  
5, [Offers Made],  
6, [Offers Accepted],  
7, [Joined]  
)
```

9 Apply the theme and set up the canvas

1. Download **AudiVW_Hiring_Theme.json** (shared with this guide in the chat).
2. Click **View** › **Themes** (the dropdown arrow) › **Browse for themes**, and open the file.
Visuals get white cards with a soft border on a light grey page, and the colour palette used in the preview.
3. Click an empty area of the canvas. In **Format your report page** › **Canvas settings**, keep **Type: 16:9** (1280 × 720).
4. Turn on **View** › **Gridlines** and **Snap to grid** so visuals line up.
5. Rename the first page tab (double-click *Page 1* at the bottom) to *Overview* . Add three more pages with the **+** button: *Interview pipeline* , *Offers and joining* , *Candidate profile* .

These colours keep meaning consistent across pages. You'll set them on legend items in steps 10–12.

Meaning	Hex	Used for
Good	#2F8F6B	Accepted outcome, accepted offers
Bad	#B84A3A	Rejected, lost offers, gap to demand
Warning	#E0A21B	No show, passed without offer
Neutral	#3D6A96	Funnel bars, in-progress offers, pending interview
Light	#8DB3D6	Rescheduled
Grey	#9AA6B2	Cancelled
Header	#14233A	Page header bar, demand line

10 Build page 1: Overview

For each visual: click an empty spot on the canvas, click the visual's icon in the **Visualizations** pane, then tick or drag fields from the **Data** pane into the wells named below. Resize and position it to match the preview.

Header bar

1. **Insert** › **Shapes** › **Rectangle**. Stretch it across the top, about 60 px high. In **Format** › **Style** › **Fill** choose #14233A and turn **Border** off.
2. **Insert** › **Text box** on top of it. Type *Audi/VW hiring funnel* (size 18, white, semibold) and on a second line *SD Analyst German, grade A4* (size 10, light grey).

Slicers (top right, on the header bar)

1. Add a **Slicer**. Field: `Candidates[Date]` . In **Format** › **Visual** › **Slicer settings** › **Options** › **Style** choose **Between**. Title it *Interview date*.
2. Add another **Slicer**. Field: `Candidates[Recruiter]` . Style: **Dropdown**. Title it *Recruiter*.
3. Select both slicers, then **View** › **Sync slicers** and tick the sync boxes for the *Interview pipeline* page so filters carry across.

Six KPI cards

1. Add a **Card** visual. Drag `_Measures[Candidates]` into **Fields**.
2. Double-click **Candidates** in the Fields well to rename what the card displays (for example *Candidates*), then in **Format** › **Visual** › **Callout value** set the font size to about 26.
3. Copy the card (`Ctrl + C` , `Ctrl + V`) five times, and swap the measure in each: **Attended Interview**, **Pass Rate**, **Offers Made**, **Offers Accepted**, **Gap to Demand**.
4. On the Gap to Demand card, set the callout value colour to #B84A3A .
5. Arrange the six cards in one row below the header. Select them all, then **Format** › **Align** › **Distribute horizontally**.

Hiring funnel (left)

1. Add a **Funnel** visual. **Category:** `Funnel Stages[Stage]` . **Values:** `_Measures[Funnel Value]` .
2. If stages appear in the wrong order, click the ... on the visual, then **Sort axis** › **Stage** and **Sort ascending**. (The sort-by-column set in step 7 makes this follow Order 1 to 7.)
3. In **Format** › **Visual** › **Data labels**, set **Label contents** to **Data value. percent of**

previous.

4. Set **Colors** to #3D6A96 and title the visual *Hiring funnel*.

Accepted offers vs demand by wave (top right)

1. Add a **Line and stacked column chart**.
2. **X-axis:** Waves[Wave] . **Column y-axis:** Offers Accepted and Offers In Progress . **Line y-axis:** Cumulative Demand and Cumulative Accepted .
3. In **Format** > **Visual** > **Columns** > **Color** set Offers Accepted to #2F8F6B and Offers In Progress to #8DB3D6 .
4. In **Lines**, set Cumulative Demand to #14233A with a **dashed** line style, and Cumulative Accepted to #2F8F6B . Turn on **Markers**.
5. Turn on **Data labels** for the two lines only (under **Data labels** > **Apply settings to**, pick each line series).
6. Under **Y-axis**, set **Range** > **Minimum** to 0 and make sure **Secondary y-axis** is **off** so columns and lines share one scale.
7. Title: *Accepted offers vs demand by joining wave*.

Offer status donut (bottom middle)

1. Add a **Donut chart**. **Legend:** Offers[Offer Status] . **Values:** Offers Made .
2. In **Slices**, colour Offer Released And Accepted #2F8F6B , Joined #1E6B4F , Offer In Process #3D6A96 , Offer Released #8DB3D6 , Offer Decline #B84A3A , Offer Voided #9AA6B2 .
3. Set **Legend** > **Position** to **Right** and **Detail labels** > **Label contents** to **Data value**.

"Passed, but no offer yet" card (bottom right)

1. Add a **Card** with Passed Without Offer . Rename the label *passed both interviews, no offer yet*.
2. Give it a left accent: **General** > **Effects** > **Visual border** colour #E0A21B , or place a thin amber rectangle on its left edge.

11 Build page 2: Interview pipeline

Copy the header bar and both slicers from page 1 and paste them here (**Ctrl + V**). When asked, choose **Sync** so the slicers stay linked. Change the header text to *Interview pipeline*.

Candidates by interview week and outcome

1. Add a **Stacked column chart**. **X-axis:** Candidates[Week Start] . **Y-axis:** Candidates . **Legend:** Candidates[Outcome] .
2. In the X-axis well, click the small arrow next to **Week Start** and choose **Week Start** (not *Date Hierarchy*). Then in **Format** › **X-axis** set **Type** to **Categorical**.
3. In **Columns** › **Color**, set Accepted #2F8F6B , Rejected #B84A3A , No show #E0A21B , Rescheduled #8DB3D6 , Cancelled #9AA6B2 , Pending interview #3D6A96 .
4. Turn on **Total labels**. Title: *Candidates by interview week and outcome*.

Where the other candidates are

1. Add a **Clustered bar chart**. **Y-axis:** Candidates[Outcome] . **X-axis:** Candidates .
2. In the **Filters** pane, under *Filters on this visual*, expand **Outcome** and tick everything except **Accepted**.
3. Sort by count descending (... › **Sort axis** › **Candidates**), turn on data labels, and colour bars to match the column chart.

Recruiter performance table

1. Add a **Table**. **Columns:** Candidates[Recruiter] , Candidates , Attended Interview , Passed Both , Pass Rate , No Shows , Show-up Rate , Offers Made .
2. Rename headers to shorter text by double-clicking each field in the Columns well (for example *Passed*, *Offers*).
3. Add traffic-light icons: in the Columns well, click the arrow on **Show-up Rate** › **Conditional formatting** › **Icons**. Set **Format style** to **Rules** and create three rules: 0.9 to 1 green, 0.75 to 0.9 amber, 0 to 0.75 red. In each rule, set the unit dropdown to **Number** (not Percent), because the measure stores rates as decimals.
4. Repeat for **Pass Rate** with 0.52 to 1 green, 0.4 to 0.52 amber, 0 to 0.4 red. Adjust the thresholds to your own targets.

Technical vs ops matrix

1. Add a **Matrix**. **Rows:** Candidates[Technical] . **Columns:** Candidates[Ops] . **Values:** Candidates .
2. In the Filters pane for this visual, keep only **Passed** and **Failed** on both Technical and Ops.
3. On the value, open **Conditional formatting** › **Background color** with a gradient from white to #3D6A96 . The two big diagonal cells will be dark; the three disagreements

stay light.

12 Build page 3: Offers and joining

Paste the header bar and change the text. This page uses different slicers, because it's about offers rather than interviews.

1. Add two **Slicers** in the header: Waves[Wave] (dropdown) and Offers[Offer Group] (dropdown). Don't sync these to other pages.
2. Add five **Cards**: Offers Accepted , Offers In Progress , Offers Lost , Offer Acceptance Rate , Passed Without Offer .

Offers by joining week

1. Add a **Stacked column chart**. **X-axis**: Offers[Joining Week] (choose the field, not the hierarchy, and set the axis type to Categorical). **Y-axis**: Offers Made . **Legend**: Offers[Offer Group] .
2. Colours: Accepted #2F8F6B , In progress #3D6A96 , Lost #B84A3A . Turn on total labels.
3. The voided offer has no date and will appear as (*Blank*). To hide it, in this visual's filter for **Joining Week** choose **Advanced filtering › is not blank**.

Offers by recruiter

1. Add a **Stacked bar chart**. **Y-axis**: Candidates[Recruiter] . **X-axis**: Offers Made . **Legend**: Offers[Offer Group] . Use the same three colours.
2. Elbarbary's offer shows as (*Blank*) because he isn't in the tracker. Add his tracker row in Excel to fix it at the source.

Offer list

1. Add a **Table**. **Columns**: Offers[Name] , Candidates[Recruiter] , Offers[Offer Status] , Offers[Joining Date] , Offers[Wave] .
2. If **Joining Date** splits into Year, Quarter, Month and Day columns, click its arrow in the Columns well and choose **Joining Date** instead of *Date Hierarchy*.
3. Sort by Joining Date ascending by clicking its column header.
4. Colour the Offer Status cells by group. First create this measure in **_Measures**:

DAX: Offer Status Colour

Copy

```
Offer Status Colour =
SWITCH (
    SELECTEDVALUE ( Offers[Offer Group] ),
    "Accepted", "#D5EDE3",
    "In progress", "#DCE7F2",
    "Lost", "#F3DCD8"
)
```

Then click the arrow on **Offer Status** in the Columns well >

Conditional formatting > **Background color**, set **Format style** to **Field value** and **What field should we base this on?** to **Offer Status Colour**.

13 Build page 4: Candidate profile (drill-through)

1. Open the **Candidate profile** page. Click an empty area, then in the **Visualizations** pane scroll to **Drill through** and drag **Candidates[Name]** into **Add drill-through fields here**. Power BI adds a Back button automatically.
2. Add a **Card** with **Candidates[Name]** (it will show *First Name*, which is correct for one person).
3. Add a **Multi-row card** with **Candidates[Recruiter]** , **Candidates[Date]** , **Candidates[Technical]** , **Candidates[Ops]** , **Candidates[Outcome]** .
4. Add another **Multi-row card** with **Offers[Offer Status]** , **Offers[Joining Date]** , **Offers[Wave]** . It stays blank for candidates without an offer.
5. Add a **Table** with only **Candidates[Feedback]** . In **Format** > **Values** turn **Text wrap** on and in **Column headers** rename it *Interviewer feedback*. Make the table wide and tall.
6. Test it: go to page 3, right-click a name in the offer list, choose **Drill through** > **Candidate profile**. In Desktop, hold **Ctrl** and click the Back button to return.

Feedback contains personal assessments. Before sharing the published report widely, consider hiding this page or limiting access (see step 15).

14 Check your numbers

With no slicers or filters applied, your report should show exactly these values. If one is off, the likeliest cause is noted.

Measure	Expected	If different, check
Candidates	131	134 means the duplicate removal step is missing (step 3).
Attended Interview	103	Spelling of "Passed" and "Failed" in the measure.
Passed Technical	55	
Passed Both	54	Outcome column values (step 3).
